

Pulse Relay

The Pulse Relay node sends 1 to the output when the input **Set** is set to 1 and sends 0 to the output when the input **Reset** is set to 1. When both Set and Reset are 0, the previous state of the output is maintained. Whenever the input **Trigger** receives a rising edge, Set and Reset are ignored and the output is toggled.

The **Behaviour** property determines whether Set or Reset must be dominant when both of them are 1.

Behavior of Pulse Relay

The Pulse Relay it is used to transform a pulse input in a toggle switch!

Set and Reset inputs are optional, if they are not connected to any other nodes, the Trigger input is the only input which controls the output.
