

## Piccolo

## ThinKnx Piccolo

Piccolo is a multitasking device that is particularly dedicated for in-room management of different scenarios such as residential buildings or hotels. It acts as a client of either Pro line or Trend line devices. The 4" screen, the embedded temperature and humidity sensors allow it to be used as thermostat, for the management and setting of temperature in each room. It is also possible to launch sceneries of set thermal comfort modality to grant the right temperature at the right time.

The graphic is characterised by an unlimited number of pages and a full set of predefined widgets, fully customised by the end user even with favourite pages. The design of the device combined with the presence of these kinds of sensors, make them well accepted by interior design since they can replace multiple cumbersome devices. In hospitality, Piccolo can be used as a customised interactive Front Door plate. The pages can be designed to show camera number and hotel logo in addition to signalling the status of the room (do not disturb and/or make up room). The ring button can be part of the graphic. Additional pages permit to interact with the Access control system using for example a QRcode. It is available in Black colour.

- Capacitive 4" touch screen
- Resolution 480x480
- 1 x KNX TP port
- 1 x Ethernet 10/100
- Wi-fi connection
- Widgets list view
- IP Camera monitoring and Doorcom functionality
- Temperature and humidity sensor
- Internal solid-state memory
- Power supply 12-30 VDC or PoE
