

Ramp

The Ramp node increases or decreases in a linear way the value of the **Output** connector until it reaches the value of the **Input** connector. The linear increment consists of adding (or subtracting) to the **Output** a value represented by the **Step size** property every time interval specified by the **Time step** property.

The value of the **Output** can't go beyond the **Input** value, so the node reduces the step to adapt the output to the input.

Behaviour of Ramp
